

Question 1:

Create a Banking Application, where a user can create new account, deposit money, withdraw money and check the balance. [You need to create a class called Account that contains the given methods]

Question 2:

Create an Employee record system for a company. The application will help the company to view the record of a specific employee (given id), update the employee's info and get the employee's current salary. (Use an array to store different types of employee objects. Subclass polymorphism should be used)

The Company has 3 types of employee (**Salaried**, **HourlySalaried**, **Commissioned**), your application must handle all types of employees.

Note:

1. Salaried Employee: Salary given at the end of each month.
2. HourlySalaried Employee: Salary calculated as: Salary per hour * No of hours worked.
3. Commissioned Employee: Has a base salary + commission for each product sold.

ALL PLAGIARISED SUBMISSIONS WILL RECEIVE 0.
